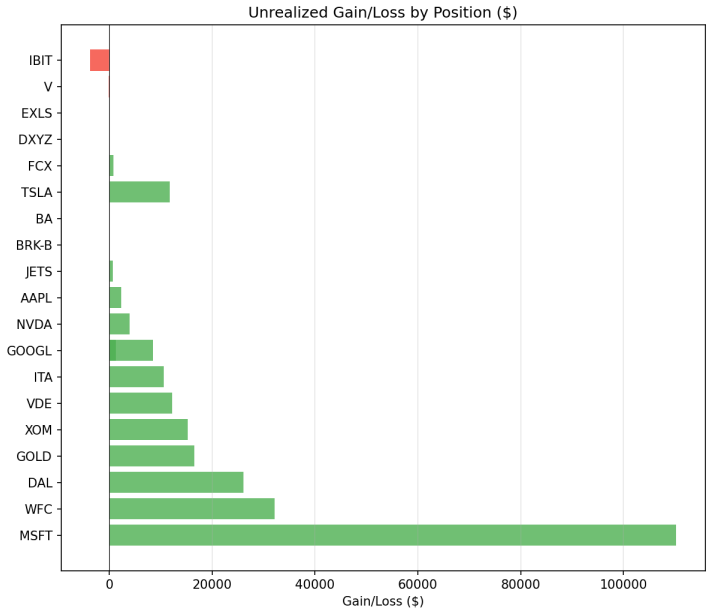
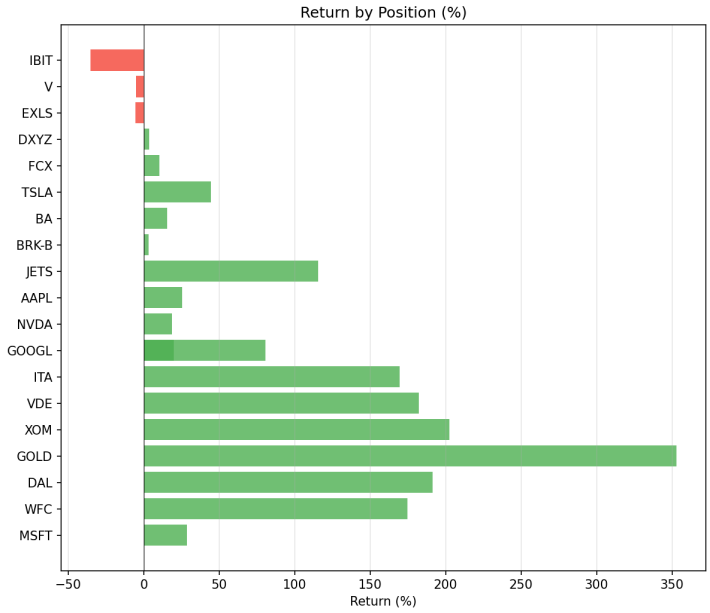
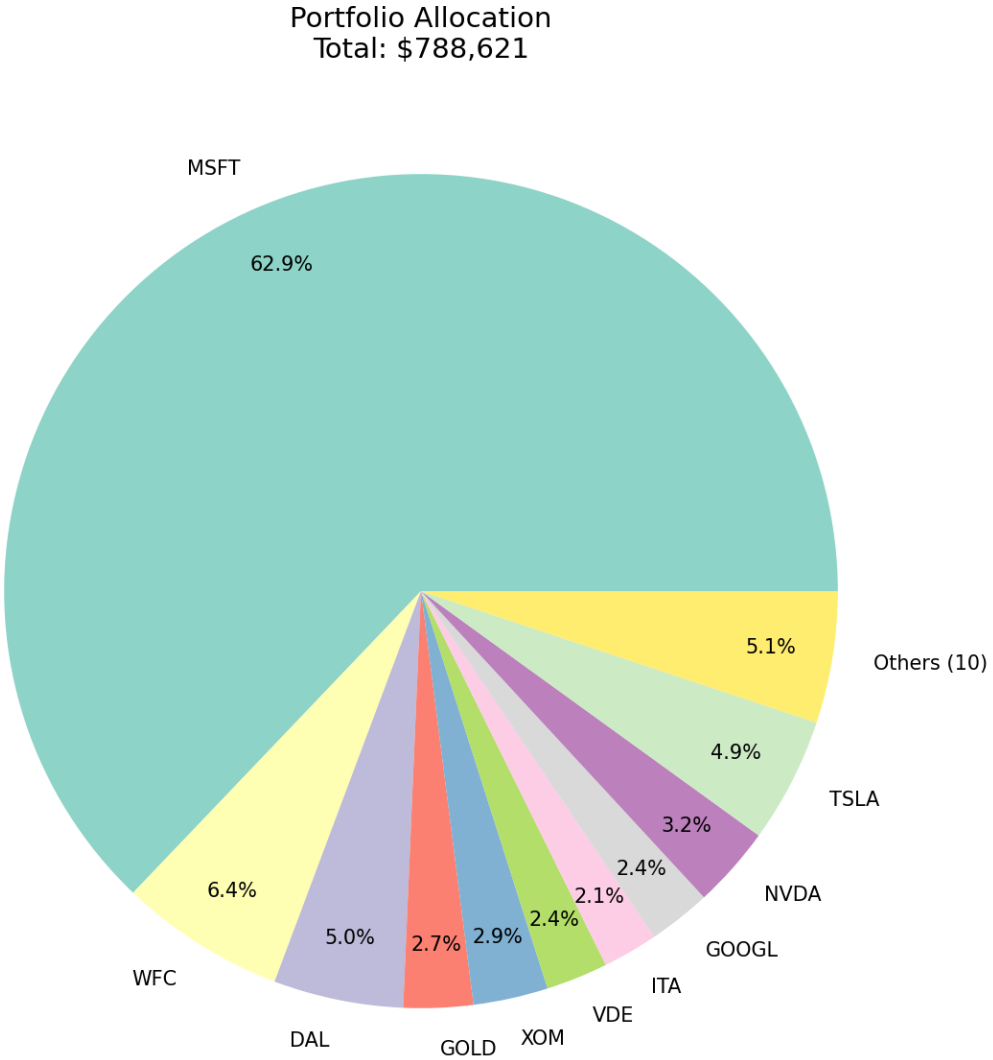
Chapter 3: Per-Stock Gain/Loss Analysis







Chapter 4: Stop-Loss Simulation

For each stock, we check when a 15% stop-loss (from cost basis) would have triggered, and whether selling at that point would have been better than holding to today.

Chapter 6: Key Findings & Recommendations

6.1 Portfolio Strengths

- Heavy MSFT/NVDA weighting benefited from AI boom (2023-2025)
- ESPP quarterly buying provided disciplined dollar-cost averaging
- Diversification across tech (MSFT, GOOGL, AAPL), energy (XOM, VDE), financials (WFC, BRK-B), and aviation (DAL, JETS, ITA)

6.2 Portfolio Weaknesses

- Pandemic-era positions (CCL, BA) created significant drag
- No systematic sell discipline led to riding drawdowns
- Aviation/travel sector overweight (DAL + JETS + ITA + BA) was high correlation risk

6.3 Aviation Sector Deep Dive (DAL)

DAL (Delta Air Lines) was purchased at ~$23.82 average cost during pandemic lows. The aviation industry experienced unprecedented disruption from COVID-19:

- 2020-2021: Passenger traffic -60%, airlines burned $5-10B/quarter cash
- 2021-2022: Gradual recovery, pent-up demand drove load factors back above 80%
- 2023-2024: Revenue exceeded pre-COVID levels, but rising fuel costs compressed margins
- 2025-2026: Strong profitability, DAL trading near all-time highs

Combined with JETS (airline ETF) and ITA (aerospace/defense ETF), the aviation allocation was ~15-20% of the Z account at cost. This high-conviction bet on travel recovery paid off significantly.

6.4 Recommendations

- Consider implementing trailing stop-losses (15-20%) for concentrated positions
- The 200-day MA trend filter would have reduced drawdowns in 2022 bear market
- DRIP (dividend reinvestment) in high-conviction names compounds well over time
- Position sizing: MSFT concentration risk is high (~40%+ of Z account)
